Next Page ⏩

## Description

The method **join()** returns a string in which the string elements of sequence have been joined by *str* separator.

## Syntax

Following is the syntax for **join()** method:

```
str.join(sequence)
```

## Parameters

**sequence** -- This is a sequence of the elements to be joined.

## Return Value

This method returns a string, which is the concatenation of the strings in the sequence seq. The separator between elements is the string providing this method.

## Example

The following example shows the usage of join() method.

```
#!/usr/bin/python  
s = "-";  
seq = ("a", "b", "c"); # This is sequence of strings.  
print s.join( seq )
```

When we run above program, it produces following result –

```
a-b-c
```
